

Lab task2:

1. Suppose the equation is $ax^2 + bx + c$. You have to input the value of a,b &c. Now write a code for finding the value of x.
2. Suppose the array contains the following data={-1,-2,13,12,14,7,6,5,4}. Now you have to search 6 using linear search algorithm. Now write a code where you have to pass the array and searching data into a user defined function named find() which prints the searching result.
